

WHAT IS NAUTOBOT?

Launched in 2021 and forked from NetBox, Nautobot is an **intended state** datastore that allows users to define the desired state of their traditional and **software-defined** networks.

Nautobot adds platform capabilities with its extensibility fostering an App Ecosystem, allowing users to drastically **extend Nautobot**, simplifying development and adoption of network automation solutions.

NETWORK AUTOMATION WITH NAUTOBOT

Nautobot is the cornerstone of any network automation architecture with robust REST APIs, GraphQL support, and native Git integration. Users define devices, interfaces, connections, IP addresses, circuits, and any other related data to drive automated network operations.

As a platform for network automation, Nautobot aggregates multiple disparate systems creating a **Single Source of Truth** for your network.

NAUTOBOT APP ECOSYSTEM

Because Nautobot is an automation platform, it has fostered a thriving App Ecosystem.

The App Platform reduces development by **70%**

and allows users to use or extend existing Nautobot Apps while enabling users to build any custom app they need.

Apps include Golden Configuration, ChatOps, Device Onboarding, Circuit Maintenance Mgmt, and more. See more on the App Ecosystem here: go.nautobot.com/apps

NAUTOBOT SUPPORT

Recognizing the need of the greater community, Network to Code, the sponsor of the Nautobot project, offers

24/7 Enterprise-class Nautobot services and support.
